

Hungerford & Terry Receives Four Orders For Arsenic Removal Systems
During the First Quarter of 2004

Clayton, NJ – Hungerford & Terry, Inc., a leader in the water purification industry for nearly 100 years, was awarded four contracts for arsenic removal systems during the first quarter of 2004.

Two of the systems were contracted by the Canyon General Improvement District in Sparks, NV. One system is designed to treat a water flow of 550 gallons per minute (gpm); the other system treats 350 gpm. Each system removes up to 34µg/L of arsenic using the H&T Catalytic Ferrosand™ process.

An additional order was received for a military base in Southern California. The system is sized to treat a flow of 100 gpm.

The fourth system is for a small community in Maryland. It consists of three 6-foot-diameter Catalytic Ferrosand Filters that together remove 17 µg/L of arsenic from a 750 gpm well.

According to Ken Sayell Vice President of H & T “Since the mid 1960’s, Hungerford & Terry’s Ferrosand Filter System has been the industry standard for the removal of iron, manganese and arsenic from water in municipal and industrial facilities. Our updated report describes this technology that is being used across the country to conform with the new arsenic MCL established by the EPA. Our Ferrosand filter system report provides critical information to help decision makers at municipal and industrial facilities select the most appropriate process and design alternatives”.

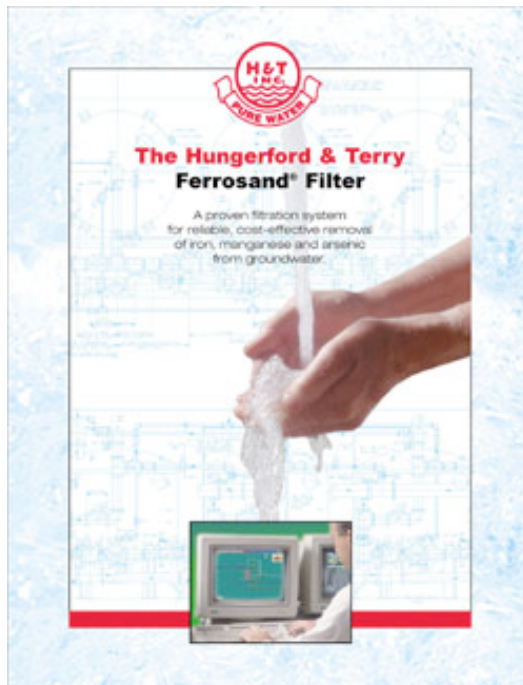

Since 1909, Hungerford & Terry has designed and manufactured thousands of systems incorporating standard and unique water treatment technologies, including ion exchange and filtration systems for corporations, utilities, water companies and municipalities.
